**Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.
- 8) As per the policy decision of Maharashtra State Government, teaching in English/Marathi and Bilingual (English + Marathi) medium is introduced at first year of AICTE diploma Programme from academic year 2021-2022. Hence if the students write answers in Marathi or bilingual language (English + Marathi), the Examiner shall consider the same and assess the answer based on matching of concepts with model answer.

Patient counselling by a pharmacist needs to be done in a systematic and organised manner in order to achieve the therapy goals. The various stages of patient counselling are

- Preparing for the counselling session
- Introduction
- Counselling content
- Counselling process
- Closing the counselling process

**Preparing for the counselling session-** Before the counselling session commences, the pharmacist should gather knowledge about the patient and the treatment details. The sources of information in a community pharmacy are the patients and their prescriptions or record of previous dispensing.

**Introduction or opening of the counselling session-** A pharmacist should introduce oneself with a smile and start the conversation after identifying the patient and in case the patient is elderly, child or illiterate, the accompanying person should be identified. It is a necessity to identify if the patient has the time for patient counselling, so can start with a sentence as ‘Can I talk to you for a few minutes?’

The following information should be gathered from the patients

- Disease and its duration
- Treatment
- Past medications
- Allergies to drugs
- Habits as alcoholism, smoking, tobacco
- Use of alternative medicines

**Counselling content-** The following points should be included in the discussion

1. Name and strength of the medicine prescribed
2. How to take the medicines
3. How long will the medication take to show effect
4. Duration for which the medicines have to be taken
5. Benefits of the therapy
6. Possible adverse effects and explain that there is no drug in the world without side-effects
7. What is to be done in case of missed dose or an adverse drug reaction
8. Possibility of drug -drug interactions or drug- food interactions
9. Precautions to be followed during the treatment
10. Proper storage conditions of the medicines
11. Any diagnostic test to be performed before starting the medicines
12. Handouts for chronic conditions like diabetes, heart disease, hypertension

**Patient counselling process**

[Visit - pharmacyindia.co.in](http://pharmacyindia.co.in)

The pharmacist explains the medications and treatment regimen to the patient. The counselling should be done with simple vocabulary in a language easily understood by the patient. Example 'This medicine is for high BP' instead of 'This medication is for hypertension.' The pharmacist should use the appropriate counselling aids like pictogram, patient information leaflets to support the counselling. The dosage marks for oral liquids should be displayed on measurement instruments. The colours, shapes, sizes and markings on the oral dosage forms should be told to the patient. Use of devices should be demonstrated.

**Closing the counselling** - The pharmacist needs to check the understanding of the patient regarding the counselling. Cross questioning or feedback questioning to the patient will help understand the pharmacist during the closing of the counselling session. The pharmacist needs to summarise the points in a sequence.

Follow up counselling can be done by the pharmacist to understand the patient's compliance of the treatment regimen.

		<p>1. Physicians: - If a location is having a good practice of more than three physicians, then 70% of business will come through prescriptions. But if physicians are dispensing their own medicines, they will prove to be competitors for the drug store.</p> <p>2. Hospital: - If a hospital or clinic has a good practice of doctors without its own pharmacy, then it is considered to be a very good location.</p> <p>3. Other drug stores: - The area where no other pharmacies exist should be selected, but if the potential is very high and already a number of pharmacies are existing then this area may be selected. This area may become a major business centre for drugs. People in large numbers may visit the area thinking that all types of medicines are available and in turn the sales increase</p> <p>4. Flow of traffic - A pharmacy should be in an area, where there is no traffic congestion. A pharmacy should not be opened near traffic signals or road circles as it may lead to traffic jams. It should be opened on that side of road which people take to reach their homes because people prefer to buy goods while returning home from their jobs</p> <p>5. Parking: - Enough parking space is always advisable when selecting a location.</p> <p>6. Business Locality: - Number of people coming to business locality is high. In this case, if shop is made attractive people may visit to purchase drug simultaneously. The disadvantage is that the shop is not easily available and the price of shop is very high. Huge investment is required to maintain the standard of pharmacy.</p> <p>7. Residential areas: - Thickly populated areas should be selected for a pharmacy. People prefer to buy medicines from nearby areas</p> <p>8.. Developing area: - Nowadays in cities new areas are developing fast. It is a good location to serve the needs of customers initially providing all types of services. Competition is not a problem in this area.</p> <p>9. Near hotels, schools, playground, cinema halls - These locations are not preferable for starting a drug store because generally people live at a distance from schools, playgrounds, hotels etc. If a site is near a restaurant, it may create a problem of maintaining cleanliness in the neighbourhood of the drug store. In case cold drinks or ice-cream facilities are also extended then it is preferable to open a pharmacy near cinema halls.</p> <p>10. Visibility &amp; accessibility: The pharmacy should be easily visible &amp; accessible to the customers. It should be on a ground floor &amp; near the footpath.</p>

		<p>The skills required for patient interview techniques</p> <p>(1) Establish rapport: In medication related issues, a patient interacts with pharmacists first as they are easily accessible. Patients share important information with them based on trust that has developed over time.</p> <p>(2) Respect patient's privacy: When pharmacists ask more difficult questions, patient privacy should be considered.</p> <p>(3) Recognize face value: Pharmacists should pay attention to patients' facial expressions. It may give clues regarding things they are not saying and may alert Pharmacists about the problem and its severity.</p> <p>(4) Consider your appearance: Pharmacist's physical appearance is equally important as with their actual speech. The way a Pharmacist presents himself determines the amount of information he would obtain from a patient. Irrelevant body language and postures may convey disinterest in what he has to say.</p> <p>(5) Probing: Probing is the use of questions to elicit needed information from patients or to help clarify their problems or concerns. "Why" type questions can make people feel that they have to justify their reason for doing a certain thing. It is better to use "what" or "how" type of questions.</p> <p>(6) One thing at a time: Pharmacists regularly conduct interviews of patients and their routine. While interviewing patients, pharmacists may think ahead on other questions while asking one question. But patients come across such interactions rarely, so pharmacists should make sure to ask their questions one at a time.</p> <p>(7) Avoid jargon: In the process of patient's interview, pharmacist and patient are best served by using common terminologies. Use only words that patients are familiar with to avoid confusion in the patient's mind.</p> <p>8) Listen actively: Pharmacists should listen to their patient's responses to questions asked. Usually being an expert, they may keep on thinking ahead to the next question instead of paying attention to what the patient is replying through his answer.</p>

		<ul style="list-style-type: none"><li>● Face to face</li><li>● Distant</li><li>❖ . Written</li></ul> <p>2) Non-verbal communication</p> <p>B) Based upon style and purpose</p> <p>1) Formal</p> <p>2) Informal</p> <p>Written communication skills:</p> <ul style="list-style-type: none"><li>• The common forms of written communication commonly employed in Pharmacy practice include prescriptions, patient's medication and test reports, letters, notices, emails, messages, advertisements and business-related documents.</li><li>• Written communication is specifically needed when the information is lengthy and consists of images, pictures, charts, graphs, statistical data and so forth. This is because conveying such information in any other form is difficult and may not be imparted orally to the individuals.</li><li>• When the individuals are communicating with each other in a written form, they need to take into account factors such as addressing appropriately, making use of decent words, stating the information in a clear and understandable manner, stating all the necessary concepts and concluding well by saying thank you and putting the name and signatures.</li><li>• Writing is often the catalyst for actions in healthcare. Pharmacists are frequently identified for their activities initiated by written documents such as updating patient records, communicating with insurers, and answering drug information questions, writing patient care plans, progress notes, treatment guidelines, patient education handouts, etc. Writing skill for a pharmacist provides much stronger legal standing than any other communication.</li><li>• Quality written records can ensure long-term success for pharmacists, especially when it comes to compliance and liability issues. In addition, pharmacists' writing is increasingly important because new technologies are continuously evolving in the healthcare sector. These days, since healthcare communication exists largely in electronic medical records and through digital platforms, it is essential that pharmacists write clearly and effectively.</li></ul>

		<ol style="list-style-type: none"> <li>1. Medication Adherence: The patient should follow the instructions as given by the doctor. The medications should not be discontinued without the doctor's advice. TB is curable if the medications are properly used as advised. Patients should be educated about common side effects and when to refer to physicians.</li> <li>2. Infection Control: In case of Pulmonary TB patients should follow cough etiquettes, should spit in a cup containing disinfectant, should try to isolate themselves from other family members especially children for at least the initial phase of the infection. Educate patient about frequency and importance of sputum examinations, (if sputum positive cases)</li> <li>3. Lifestyle Modifications: Lifestyle Modifications, especially related to physical activity and avoiding the use of alcohol and nicotine have several benefits.</li> <li>4. Physical Activity: Physical activity must be enjoyable and sustainable. However, in TB cases, there is restricted lung capacity. Expert advice is necessary before initiating any regular exercise programme.</li> <li>5. Use of Contraceptives: If there is a female patient who is taking Oral Contraceptive Pills (OCPs), then she should be advised to use alternative methods of contraception.</li> <li>6. Diets: A healthy balanced diet is essential. A patient generally has poor appetite initially and it is better to start with "eat small and frequent nutritionally balanced meals". The Government provides Rs. 500/- per month to notified TB patients as nutritional support.</li> <li>7. Tobacco Cessation: All are encouraged to quit all forms of tobacco use.</li> <li>8. Alcohol Intake: Reducing alcohol intake can have several health benefits. In addition, it increases drug toxicity in TB.</li> </ol>

		<p>1) Level of prescribing:</p> <p>Medication non-adherence may occur because patients perceive it to be unnecessary or because of their fears and beliefs related to adverse effects of drugs. Hence, providing clear medication related information to patients is essential to improve adherence. Complexity of drug regimen is found to negatively affect medication adherence.</p> <p>Corrective measure- Modification will have to be made to medication regimens to reduce the frequency of administration, and/or reduce the number of different medications, and if applicable, to replace with combination products. This method often calls for patient's cooperation, thus highlighting patient participation in disease management.</p> <p>2) Medication adherence is adversely affected by patient-related factors that are closely linked to the other factors previously discussed. Most of the time patient behavioral factors may not be perceived well by the doctors resulting in decreased adherence. Most variations in taking medication occur include omission of doses or delays in the timing of doses.</p> <p>Patients with low literacy usually have difficulties in understanding instructions; which ultimately results in decreased adherence and poor medication management. The list of these factors includes:</p> <ul style="list-style-type: none"><li>(a) Physical factors</li><li>(b) Visual impairment</li><li>(c) Hearing impairment</li><li>(d) Impaired mobility/dexterity</li><li>(e) Swallowing problems</li><li>(f) Psychological/behavioral factors</li><li>(g) Motivation</li><li>(h) Fear of possible adverse effects</li><li>(i) Fear of dependence</li><li>(j) Feeling stigmatized by disease</li><li>(k) Frustration with healthcare providers</li><li>(l) Psychosocial stress/anxiety/anger</li><li>(m) Alcohol/substance abuse.</li></ul>

		<p>(n) Chronic diseases</p> <p>Corrective measures- Communicating with the patient</p> <p>(a) Explain key information when dispensing medicine for the patient. Address the key information, such as what, why, when, how, and how long, about the medications.</p> <p>(b) In advance, inform and caution the patients about the common side effects, else they would be more worried that may lead to non-adherence.</p> <p>(c) Use medication adherence improving aids that specify the time to take medications such as medication calendars or schedules, drug cards, medication charts, medicine related information sheets, specific packaging such as pill boxes, unit-of-use packaging, and special containers indicating the time of dose.</p> <p>(d) Collaborate with patients, especially elders, to incorporate the medication regimen into their daily complex regimen having unintentional difficulties in adherence.</p> <p>3) Packing: The container used to pack pharmaceutical formulations should not only help to protect it from environmental conditions, but also it should be handy, easy to store and carry.</p> <p>For example, Geriatric patients or arthritic patients, especially those staying alone may encounter problems during removal of dose from blister packs/strips.</p> <p>Corrective measure: In such cases, a pharmacist should supply loosely packaged dosage forms in appropriate easy to open containers.</p> <p>4) Complex therapeutic regimen: More number of medicines per day not only increases chances of forgetting the dose but increases risk due to drug interactions.</p> <p>Corrective measure: Dosing schedule is planned at different times.</p>
